Low Protein Grower and Layer Diets and Their  
Effects on Reproductive Performance

R. A. Nelson<sup>1</sup> and C. W. Carlson<sup>2</sup>

Previous experiments have shown that low density grower diets can more economically produce layer-type pullets without affecting their subsequent reproductive performance. Generally, weight gain during the 8- to 20-week grower phase is not affected by these diets, while feed efficiency is somewhat reduced. This report shows the reproductive performance data for the hens from last year's grower study in which the low density type diets were used.

Six replicates of 12 24-week-old pullets from each of three commercial strains were housed at the rate of four birds per 16-inch cage and fed one of two layer diets (Table 1). Performance data were collected for 13 28-day periods.

Table 2 shows some of the production data for the completed reproductive cycle. Grower diets had no effects on subsequent egg production, feed utilization or final body weight. Strain differences were noted for most parameters measured, while the 12% protein diet supported 4% less production than the 16% protein diet.

Table 3 shows the body weight, mortality and some of the liver data for this experiment. No definite trends could be noted due to grower diet for these parameters. The 12% layer diet reduced weight gain and mortality, while it had no effect on liver fat accumulation. Larger differences were noted between strains, with strains 2 and 3 gaining less weight and strain 3 having less mortality. This decreased mortality could partially be attributed to less fat accumulation and the resulting low level of fatty liver hemorrhagic syndrome (Table 4) for strain 3.

These data confirm previous observations that low density grower diets are quite satisfactory for subsequent egg production. There was no need for supplementation with methionine and lysine in these diets. Although a 12% protein layer diet supported about 4% less production than a 16% protein diet, there could be times when 12% protein would be most economical.
